This sequence encodes a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence encodes OCIF-C22S in which the 22nd Cys residue in the mature OCIF protein is substituted by Ser. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       540

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CACAACCGCGTGTGCGAATGCAAGGAAGGGCGCTACCTTGAGATAGAGTTCTGCTTGAAA 360
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence encodes the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. The OCIF has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OUIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         atgaacaacttgctgtgctgcgcgctcgtgttttctggacatctccattaagtggaccacc 60

DNA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis claim 39; Page 136-137; 183pp; Japanese This sequence encodes a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence encodes OCIF-C23S in which the 23rd Oys residue in the mature oCIF protein is substituted by Ser. The OCIF of the invention has molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C. OCIF is useful in the control of bone resorption and therefore
                                                                                                                                                                                                                                600
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             22-APR-1997 (first entry)

DNA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis claim 30; Page 133-134; 183pp; Japanese.

This sequence encodes a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence encodes OCIF-C20S in which the 20th Cys residue in the mature ociF protein is substituted by Ser. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the present and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             gtttgcaaagatgtccagatggttcttctcaaatgagacgtcatctaaagcaccctgt 480
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               421 GITIGCAAAAGAIGICCAGAIGGGITCTICTCAAAIGAGACGICAICTAAAGCACCCIGT 480

DNA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis Claim 27; Page 132; 183pp; Japanese.

This sequence encodes a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence encodes OCIF-C19S in which the 19th Cys residue in the mature OCIF protein is substituted by Ser. The OCIF of the invention has molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C. or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cataggagctgcctcctggatttggagtggtgcaagctggaaccccagagcgaaataca 420

for bone rescription control, esp. treatment of osteoporosis Claim 57; Page 142-143; 183pp; Japanese.
This sequence encodes a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence encodes OCIF-DDD2 in which amino acids 233-326 of the mature protein have been deleted. The OCIF of the invention has a molecular protein have been deleted. The OCIF of the invention has a molecular non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 in the control of bone resorption and the treatment and prevention of disorders of bone resorption, e.g. osteoporosis. sequence encodes OCIF-CDD2 in which amino acids 252-380 of the mature protein have been deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of Go kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C. or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g. osteoporosis.

                                                                                                                            ò
                                                                                                                                                                                                                                                                              DNA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis Claim 42; Page 137-138; 183pp; Japanese.

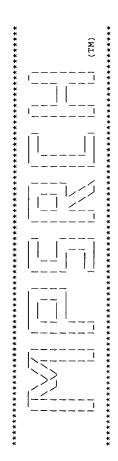

This sequence encodes mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence encodes OCIF-DCR1 in which amino acids 2-42 of the mature protein have been deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g. osteoporosis.

for bone resorption control, esp. treatment of osteoporosis
Claim 54; Page 141-142; 183pp; Japanese.

This sequence encodes a mutated version of the full length
osteoclastogenesis inhibitory factor (OCIF) of the invention. This
sequence encodes OCIF-DDD1 in which amino acids 178-252 of the mature
protein have been deleted. The OCIF of the invention has a molecular
weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under
non-reducing conditions. The protein is adsorbed onto cation-exchangers
or heparin and its activity is lowered after 10 mins at 70 deg.C or 30
mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful
in the control of bone resorption and therefore in the treatment and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   121 tgtgacaaatgtcctcctggtacctacctaaaacaacactgtacagcaaagtggaagacc 180

osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-DDD2 in which amino acids 25-326 of the mature OCIF protein are deleted. The OCIF protein are deleted. The OCIF protein are deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C. and is lost after 10 mins at 70 deg.C. corgr is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 for bone resorption control, esp. treatment of osteoporosis
Claim 53: Page 111-113; 183pp; Japanese.
This sequence represents a mutated version of the full length
osteoclastogenesis inhibitory factor (OCIF) of the invention. This
sequence represents OCIF-DCR4 in which amino acids 123-164 of the
mature OCIF protein are delated. The OCIF of the invention
has a molecular weight by SDS-PAGE of 60 Bunder reducing conditions
and 120 kD under non-reducing conditions. The protein is adsorbed onto
cation-exchangers or heparin and its activity is lowered after 10 mins
at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90
deg.C. OCIF is useful in the control of bone resorption and therefore
in the treatment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      23-APR-1997 (first entry)

for bone resorption control, esp. treatment in the forbest of claim 47; Page 107-109; 183pp; Japanese.

This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-DCR2 in which amino acids 43-84 of the mature OCIF protein are delated. The OCIF ob under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or hepatin and its activity is lowered after 10 mins at 70 deg.C. or 30 mins at 56 deg.C, and is lost after 10 mins at 70 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                                                       Osteoclastogenesis inhibitory factor; OCIF; heparin; bone resorption; osteoporosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Mutated OCIF, OCIF-DCR3. NA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis claim SO, Page 109-111; 183pp; Japanese.

This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-DCR3 in which amino acids 85-122 of the mature OCIF protein are deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto action-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The providing obteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis forlaim 44, Page 105-107; 183pp; Japanese.

This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-DCR1 in which amino acids 2-42 of the mature OCIF protein are deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              23-APR-1997 (first entry)
Mutated OCIF, OCIF-DCR1.

This sequence represents the meture osteoclastogenesis inhibitory factor (OCIF) of the invention. The OCIF has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C., and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

Tor bone resorption control, esp. treatment of osteoporosis

Claim 80; Page 126-128; 183pp; Japanese.

This sequence represents a mutated version of the full length
osteoclastogenesis inhibitory factor (OCIF) of the invention. This
sequence represents OCIF-CBst in which Gln 371 is substituted by
Leu and amino acids 373-380 of the mature OCIF protein are deleted.
These changes are caused by the introduction of a restriction site in
the DNA encoding this protein. The OCIF of the invention has a
molecular weight by SDS-PAGE of 60 Nb under reducing conditions.

and 120 Nb under non-reducing conditions. The protein is adsorbed onto
cation-exchangers or heparin and its activity is lowered after 10 mins
at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 6 deg.C. ocif is useful in the control of bone resorption and therefore
in the treatment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  osteoolastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-CL in which amino acids 379-380 of the mature OCIF protein are deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C. or 30 mins at 56 deg.C. and is lost after 10 mins at 20 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             23-APR-1997 (first entry)
Mutated OCIF, OCIF-CL.
Osteoclastogenesis inhibitory factor; OCIF; heparin; bone resorption; osteoporosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DNA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis claim 41. Page 103-105; 183pp; Japanese.

This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-C23S in which the 23rd Cys residue in the mature OCIF protein is substituted by Ser. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg. C or 30 mins at 56 deg. C, and is lost after 10 mins at 90 deg. C. OCIF is useful in the control of bone resorption and therefore in the control of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

Wright and osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis claim 3.7 Rage 96-98. I83pp. Japanese.

This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-C20S in which the 20th Cys residue in the mature OCIF protein is substituted by Ser. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 Wounder reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto eation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Mr. DDA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis claim 29; Page 94-96; 183pp; Japanese.

This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-C19S in which the 19th Cys residue in the mature OCIF protein is substituted by Ser. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C. or 30 mins at 56 deg.C. and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore the treatment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         22-AFR-1997 (first entry)
Mutated OCIF, OCIF-C19S.

Page 100-102, 183pp; Japanese.

This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-C225 in which the 22nd Cys residue in the mature OCIF protein is substituted by Ser. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg. C or 30 mins at 56 deg. C, and is lost after 10 mins at 70 deg. C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DNA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis Disclosure; Page 64-66, 183pp, Japanese.

This sequence represents the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. The OCIF has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          22-AFR-1997 (first entry)
Full length osteoclastogenesis inhibitory factor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New DNA fragment contg. gene for detecting resistance -
to kanamycin and gentamycin from Streptococcus plasmid, and new
expression prod. for making hybridisation probes
Claim 6; Page 27 and Fig 3; 34pp; French.
SO in n81668 codes for a protein imparting resistance to kanamycin and
gentamycin. The DNA is useful for making hybridisation probes to detect
kanamycin and gentamycin resistance in clinically-isolated cell cultures.
Sequence 505 AA,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 2: Column 19-26; 17pp; English.
Human tumour suppressor protein HTS-1 (R90766) is produced by procaryotic or eucaryotic host cells transformed or transfected by a vector including an isolated HTS-1 coNA (T12473). Expression of HTS-1 is associated with tumour suppression. The purified HTS-1 protein can be used to raise antibodies for use in HTS-1 detection. Sequence 1137 AA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     diagnosis and treatment of leukaemias, partic, acute
lymphoblastic or nonlymphoblastic leukaemia
[Jaim 53; Page 134-135; 207pp; English.
Monoclonal antibodies which bind to at least part of the chimeric
ALL-L/AR-17 protein (R66459) or to part of the AR-17 protein (see
R66460 and R66461) are claimed. The antibodies are useful for
diagnosing acute lymphoblastic and non-lymphoblastic leukaemia.
                                                              AF-17 protein, N-terminal region with similarity to peregrin. Acute lymphoblastic leukaemia, chromosomal translocation; abnormality, detection; chimeric ALL-1/AF-17 protein; ALL-1 fused gene on chromosome 17.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 R23005;
29-OCT-1992 (first entry)
Protein transcribed from the mba sequence of plasmid pKDSC50.
Virulent; Salmonella choleraesuis; mouse bacteremia; Salmonella.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;

The receptor binds to TNF, and in particular, TNF-beta.

The receptor may be used for screening for antigonists and agonists of the receptor may be used for screening for antigonists may be used to inhibit the growth of tumours, to stimulate cellular differentiation, to mediate the immune response and anti-viral response, to regulate growth and provide resistance to certain infections. The antagonists may be used therapeutically, to treat autoimmune diseases, inflammation, septic shock, to inhibit graft-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           03-JÄN-1997 (first entry).

The present sequence is that of the daunorubicin 14-hydroxylase, isolated from Streptomyces peucetius strain 2005. The enzyme converts daunorubicin to doxorubicin, an anthracycline used widely as an antitumour agent. A vector contg. the drxA gene (733617) could be used to transform a suitable host cell which produces daunorubicin, in order to enhance bioconversion of daunorubicin to doxorubicin. Bioconversion can be carried out either by using directly the free or immobilised transformed cells or by isolating the enzyme, which can be used in the free form or immobilised to resins, glass, cellulose or similar substances by ionic or covalent bonds, or graffed to fibres permeable to the substrate or insolubilised by cross-linkage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Detoxification of fumonisin and related mycotoxin cpds. in grains - using an enzyme esp. an esterase, from Exophiala spinifera, using an enzyme esp. an esterase, from Exophiala spinifera, Rhinocladdella atrovirens or a bacterium Example 8; Pages 33-34; Stapp: English.

The present sequence is the Exophiala spinifera (ATCC 74269) The present sequence is the Exophiala spinifera (ATCC 74269) The present sequence is the Exophiala spinifera (ATCC 74269) The present sequence is the Exophiala spinifera (ATCC 74269) The present sequence is the Exophiala spinifera (ATCC 74269) The present sequence or temperature of the microcorganisms, capable of pants and genetically engineered microcorganisms, capable of expressing the esterase. The microcorganisms can be used as a problem of the processed grain of the harvested grain, or in the processed grain) prior to its use as an animal feed.

including exons from two separate receptors, having improved growth performance in serum-free medium bisclosure; Fig 3: 57pp; English.

The amino acid sequence is that of the soluble insulin-like growth factor (IGF) receptor. It is used here as part of a fusion protein produced by a hybrid DNA insert comprising a DNA sequence encoding part of the extracellular domain of the IR and a sequence coding for part of the ECD of an insulin like growth factor (IGF). Cells contg. this insert have better growth characteristics in both serum-contg. and partic. serum-free media. This makes them useful for expressing polypeptides (e.g. human blood clotting factors; issue plasminogen activator; human protein C), encoded by a third DNA sequence. The polypeptides of an now be purified more easily and produced in better yield. See
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New hybrid cellular receptor - has 2 sequences encoding extracellular domain of receptors having different ligand binding extracellular domain of receptors having different ligand binding provided by 37pp; English.

Proposition of the sequence was deduced from a cDNA sequence prepd. from mRNA isolated from human term placenta by PCR amplification. The full sequence was assembled from four subcloned fragments and was found to be identical to that published by Ullrich et al. (The EMBO Ournal 5(120), 1986, pp 2503-2512). The DNA can be ligated to DNA encoding a sol. insulin receptor (see 014813) to prepare hybrid proteins. The new receptors are useful for screening for ligands of control collising the ligand binding site. They are also useful for establishing the 3-D structure of the ligand binding site and control of the sequence or functional equivalents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

Mammalian cells contg, hybrid DNA for extracellular receptor including exons from two separate receptors, having improved strowth performance in serum-free medium Disclosure; Fig 4: 57pp; English.

The amino acid sequence is that encoded by a hybrid DNA insert comprising a DNA sequence encoding part of the extracellular domain of the IR and a sequence coding for part of the ECD of an insulin like growth factor (IGF). Cells contg, this insert have better growth characteristics in both serum-contg, and partic. serum-free media. This makes them useful contexing polypeptides (e.g. human blood clotting factors; tissue plasminogen activator; human protein C), encoded by a third DNA sequence. The polypeptides can now be purified more easily and procedured in better yield. See also R14402.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 20.106; Variance 27.499; scale 0.731

CC -!- FUNCTION. HAX BE INVOLVED IN THE PHYSIOLOGICAL PROCESSES OF BRAIN

CC ACTIVITY MAY BE DUE TO THE SUBSTITUTION OF AN ASPATATE RESIDUE

PORTHE SERINE RESIDUE IN THE PROPOSED CATALYTIC TRAD.

-!- SUBGELLULAR LOCATION: TYPE II MEMBRANE PROTEIN (PROBABLE).

-!- SIBCELLULAR LOCATION: TYPE II MEMBRANE PROTEIN (PROBABLE).

-!- TISSUE SPECIFICITY: PREDOMINANTLY EXPRESSED IN THE BRAIN. DPDX-L.

IS EXPRESSED EXCLUSIVELY IN THE BRAIN WHEREAS DPPX-S IS FOUND IN CC -!- ALTERNATIVE SPLICITY: A SHORT FORM (DPPX-S) AND A LONG FORM (DPPX-L).

CC -!- SIMILANTY: BELONGS TO PEPTIDASE FAMILY S9B; ALSO KNOWN AS THE PROLICE SHOWN HERE IS THAT OF THE LONG FORM (DPPX-L).

CC -!- SIMILANTY: BELONGS TO PEPTIDASE FAMILY S9B; ALSO KNOWN AS THE PROLIC.

YOKOTANI N. DOI K., WENTHOLD R.J., WADA K.;

HUM. MOL. GENET. 2:1037-1039(193).

-!-FINCTION: MAY BE INVOLUED IN THE PHYSIOLOGICAL PROCESSES OF BRAIN
FUNCTION: MAY BE DIVED TO THE SUBSTITUTION OF AN ASPARTATE RESIDUE
FOR THE SERINE RESIDUE IN THE PROPOSED CATALYTIC TRIAD.

-!- SUBCELLUAR LOCATION: TYPE II MEMBRANE PROTEIN (PROBBLE).

-!- TISSUE SPECIFICITY: EXPRESSED PREDOMINANTLY IN BRAIN.

-!- TISSUE SPECIFICITY: ASPRESSED PREDOMINANTLY IN BRAIN.

-!- TISSUE SPECIFICITY: BERODICES A SHORT FORM (DPPX-S) AND A LONG FORM (DPPX-L).

-!- SHOWN HERE IS THAT OF THE LONG FORM (DPPX-L).

-!- SHUMLARTIY: BELONGS TO PEPTIDASE FAMILY S9B; ALSO KNOWN AS THE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        MIM: 126141; -
